

Education

University of Florida | Bachelor of Science in Computer Science

- **GPA:** 3.97/4.00 | Herbert Wertheim College of Engineering | Honor's Program | Dean's List Recipient
- **Related coursework:** OS, DSA, Computer Organization, Databases 1+2, Applied Machine Learning, Networking, NLP

Skills

Programming Languages: Java, Scala, Python, C++, SQL, TS, Ruby, JS, HTML, CSS

Expertise: Distributed Systems, Distributed Databases, Cloud Microservices, SQL Query Optimization, MCPs

Frameworks and Libraries: AWS SDK/CDK, Claude Code, React, Scikit Learn

AWS Stack: DDB, EC2, S3, Athena, EMR, SQS, Lambda, CW, IAM, Glue, LF, CF, ECS, ECR, DevOps Tools, StepFunction

Experience

Amazon Web Services SDE | Amazon Athena and EMR (August 2024 – Present)

Individual Contributor for Athena, a cloud platform that runs billions of queries weekly, built on a distributed microservice architecture, backed by Spark and Trino | QE/QO on Spark/Trino/Presto for Athena and EMR on EC2.

SQL Query Execution and Optimization - Improve the engine execution layer of the Athena and EMR lifecycle, focusing on optimizing performance and memory utilization. Some examples include:

- Investigated and fixed low level memory management issues in Trino's hash aggregation algorithm that when exposed to petabyte-scale workloads, exploded operator memory, triggering OOM for grouped aggregations.
- Upgraded, reconciled, and productionalized internal forks of Trino across Athena and EMR to provide customers with the latest features from OSS.
- Investigated and fixed non-deterministic behavior in Trino's window function planning. Contributed the fix [upstream](#).

Distributed Systems - Developed numerous features on top of Athena's distributed, multi-tenant architecture

- Architected and built a new framework for Athena SQL engine consumption. This cross-org work culminated in 60+ PRs and 10+ independent design docs across multiple microservices that delivered new foundational capabilities of multi-version SQL support. This work is triggered in the hot path for every query submitted to Athena.

Miscellaneous - Operations, developer experience, release safety and consistency

- Built an extensive, massively-parallelizable CI/CD framework that sped up the Athena engine dev cycle by 60%.
- Designed, built and integrated a stress-test framework to validate engine performance across releases, preventing engine regressions from ever reaching production.
- Remediated the Parquet-Avro [CVE-2025-30065](#) for EMR Trino across all EMR releases from 5.x-7.x.

Amazon Web Services SDE Internship | Amazon EMR (May 2023 – August 2023)

- Created an E2E feature for proxy customization, creation, and attachment, augmenting the existing warm pool mechanism.
- Condensed the proxy testing procedure from 2-3 hours to 10 minutes and 1 CLI command.

Personal Projects

ImLiterate – ShellHacks 2022 (Fall 2022)

- Developed a full stack web app to help kids with unequal access to education improve upon their vocabulary.
- Built with Django, Python, Google Cloud Vision, Bootstrap, and the Merriam Webster API

The Move (Summer 2022 – Fall 2022)

- Developed a full stack mobile app to help college students better plan their nights. Users can vote where they are planning on going as well as view other users' votes and how popular various locations are.
- Built with the Kivy library, Django, and Python.

Pulsar (Summer 2022)

- Created a 2D space fighter game where players battle in a dog fight with lasers, missiles, and more!
- Built with C#, Unity 2D and Photoshop.
